Corvus Health: systems behind cashless pre-authorisation

As documented by IT and Data, October 2026. Volumes: about 1,800 pre-authorisation requests and 2,600 reimbursement claims a day. Synthetic, for teaching.

	Interface	What it offers	Access	Data freshness	Known behaviour
A	Intake gateway feed	A copy of each new delivery and its documents	Read	Near real time (under 2 min)	The same request is sometimes delivered more than once
B	DocVault read API	List and read the documents for a request, with upload times	Read only	Real time	Returns superseded versions too, unless you ask for the latest only
C	ClaimCore read API	Member and policy lookup by member ID; search by name	Read only	Replica refreshed nightly at 02:00	ID lookup needs an exact match; name search returns every namesake. Members added today appear tomorrow
×	ClaimCore write	None. Decisions are keyed in by processors	–	–	The vendor quotes 4 months to build a write API
D	Work-queue tagging API	Add a tag and a note to a request in the queue	Write (tags and notes only)	Real time	Returns success with an error in the body if the request is already assigned
E	Warehouse SQL	Reporting queries over claims history	Read only	Previous day	For analysis, not for live decisions

Any new system that touches member data needs a security review under ISP-07. All service accounts are named and read-only unless a write is approved.
